Indian Institute of Information and Technology Vadodara

2023 – Present

Bachelor of Technology - Computer Science Engineering

Courses: Machine Learning, Image Processing, Artificial Intelligence, Cryptography and Network Security, Database Management System, Software Engineering, Object Oriented Design & Programming, Design and Analysis of Algorithms, Introduction to Data Structures

SKILLS SUMMARY

- **Languages:** C, C++, JavaScript, Python, Bash, Rust, Ruby on Rails
- **Web Development:** React.js, Node.js, Next.js, Express.js, HTML, Tailwind CSS, REST APIs
- **Blockchain & Web3:** Web3.js, Redis, Solana Realms, Anchor, Backpack, Phantom
- **Databases & Tools:** Azure, Docker, Kubernetes, MongoDB, MySQL, Git, IntelliJ, VS Code, Linux
- **Research & Writing:** Technical Writing, Research Documentation, LaTeX, Project Documentation
- **Others:** MATLAB

EXPERIENCE

Open Source Contributor — CircuitVerse

Dec 2025 – Present

- Created 9+ issues and submitted 10+ pull requests, with 10 PRs merged into the main codebase.
- Contributed improvements across 5+ UI components/pages, enhancing dashboard usability and user experience.
- Participated in 15+ maintainer interactions through PR reviews, issue discussions, and change requests to align with project standards.
- Followed end-to-end open-source workflow across 4 stages: branching, issue tracking, PR reviews, and clean commit history management.

Fullstack Developer — Jayess Builders

July 2025 – Sept 2025

- Established a full-stack web platform using React.js, Node.js, and Express.js to showcase 15+ projects and manage client interactions.
- Devised RESTful APIs and database schemas for smooth user-service communication.
- Deployed a responsive frontend with React and Tailwind CSS and reducing bounce rate by 40%.
- Handling deployment and production readiness by aiming to reduce page load time by 50%.

PROJECTS

Pixel Art: Interactive Pixel Drawing Platform (TypeScript, Kubernetes, HTML, CSS):

[GitHub](#)

- Developed a browser-based pixel art editor with 12 drawing primitives, 15+ editing operations, and a modular architecture spanning over 20 classes and 10+ utility functions.
- Cut redraw latency by 40% via selective canvas re-rendering; reduced bundle size by 30% through optimized asset loading and modular rendering utilities.
- Raised Lighthouse score from 68 to 85; built responsive layouts supporting 6+ screen sizes and documented all utility functions via TypeDoc for long-term maintainability.
- Containerized and deployed the app on Kubernetes using 4 manifest files (Deployment, Service, Ingress, Namespace).

Smart Fisheries: Leveraging Blockchain for Govt. Schemes (Javascript, Solidity, Kubernetes, HTML, Hardhat):

[GitHub](#)

- Implemented role-based access control for 5 user roles (Fishermen, Inspectors, Consumers, Government, Auditors) with 15+ smart contract functions.
- Managed end-to-end lifecycle across 7 stages; catch logging, verification, dispute handling, buy-back and more.
- Created and tested 6 modular Solidity smart contracts, cutting transaction verification time by 60% via automated on-chain validation; enabled tamper-proof tracking for 100+ simulated fish batches using blockchain event logging.
- Orchestrated multi-service deployment on Kubernetes across 8 manifest files covering backend, frontend, secrets, configmaps, and ingress within a dedicated **fishchain** namespace.

SafePoll: Digital Voting System (React, Node.js, OAuth + JWT, Kubernetes, Cryptography):

[GitHub](#)

- Built a secure voting app with 2 roles (Voter, Election Authority), separate dashboards, and RBAC across 10+ protected workflows and API endpoints.
- Delivered 4 core features: user authentication, candidate listing, anonymous vote casting, and result publishing; designed full election lifecycle covering creation, configuration, monitoring, and report generation.
- Secured votes via OAuth + JWT and cryptographic hashing; stored 1000+ encrypted vote records in MongoDB with minimized unauthorized access risk.
- Deployed a 3-tier architecture (frontend, backend, MongoDB StatefulSet) on Kubernetes with persistent volume claims.

CERTIFICATIONS AND ACHIEVEMENTS

- **Fundamentals of Deep Learning, Nvidia:**
- **Data Science, British Airways:**
